Experiment No. 12

Student Name: Ojaswini Thote

PRN: 24070521048

Experiment Title

Build an interactive real-time web app using JavaScript and jQuery with DOM, events, storage, and AJAX integration.

Software / Tools Required

- Visual Studio Code
- Web browser
- HTML5 and CSS3
- JavaScript
- jQuery 3.7.1
- JSON data file
- Web Storage: localStorage and sessionStorage
- AJAX using $.ajax()

Practical — Wanderly: Your Trip Planner

Aim

To develop an interactive travel-planning web application using JavaScript and jQuery that loads destination data asynchronously from a JSON file, displays destination cards dynamically, supports search and category filtering, manages a day-wise itinerary, and stores trip data in browser storage.

Files Used

File	Purpose
index.html	Defines the Wanderly page structure, sections, controls, and loads jQuery and script.js.
script.js	Uses jQuery for DOM manipulation and events, AJAX for loading destinations, and browser storage for itinerary persistence.
style.css	Provides the pastel travel-themed layout, destination cards, itinerary panels, and responsive styling.
destinations.json	Contains destination objects including name, region, category, description, estimated cost, duration, emoji, and artwork type.

Program Code

index.html

```

Working / Concepts Used

Concept / Function	Purpose
jQuery $(document).ready()	Runs the application setup after the document is ready.
AJAX $.ajax()	Requests destinations.json asynchronously and handles success, error, and completion.
JSON	Stores the destination records in a structured format.
DOM manipulation	Creates destination cards, itinerary items, status messages, counters, and progress indicators dynamically.
Event handling	Responds to clicks, form submissions, checkbox changes, search input, and category selection.
localStorage	Saves the itinerary as JSON so it can persist across browser sessions.
sessionStorage	Tracks the number of visits within the current browser tab session.
setInterval()	Updates the live clock every second.
setTimeout()	Hides toast notifications after a short delay.
Filtering	Searches destination names, regions, and descriptions and filters by category.
Array methods	Uses methods such as filter(), find(), some(), reduce(), and forEach()/$.each() to manage data.
Responsive CSS	Uses grid layouts and media queries to adapt the layout to smaller screens.

Features

- Travel-themed landing page with a live clock.
- Loads six destination records from destinations.json through AJAX.
- Displays destinations as dynamic cards with category, estimated cost, description, and duration.
- Searches destinations and filters by category.
- Adds destinations to a day-wise itinerary and prevents duplicate destinations.
- Allows users to add custom activities, mark them complete, and remove them.
- Provides controls to clear completed items or clear the full trip.
- Automatically saves itinerary data in localStorage.
- Uses sessionStorage to track visits during the current tab session.
- Displays itinerary counts, estimated budget, activity completion percentage, and a progress bar.
- Shows toast notifications for user actions and loading results.

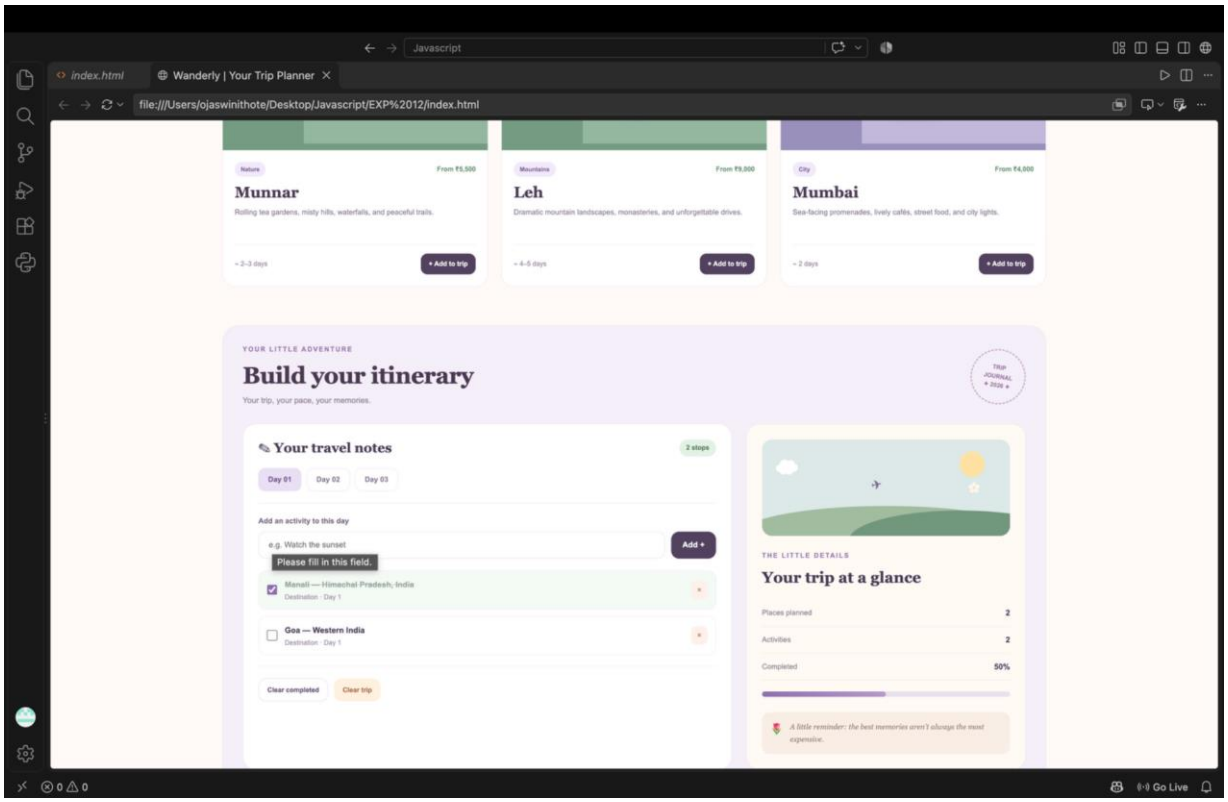

Figure 2: Day-wise itinerary planner and trip summary

Result / Conclusion

The Wanderly travel planner demonstrates how JavaScript and jQuery can be combined for DOM manipulation, event handling, AJAX integration, and browser storage. Destination data is loaded dynamically from JSON, and users can build and manage an itinerary with live summary updates. The application also demonstrates responsive design and temporary notifications, making the trip-planning experience interactive and user-friendly.
